

pHix® Compact pH, redox and temperature transmitter

General

With the advanced and unique design of the pHix® Compact, pH can now be measured much easier than before, and nearly all drawbacks of conventional measuring systems are eliminated.

The compact design, with union in one end and male thread in the other end, makes pHix® Compact very simple to mount in pipelines and open tanks.

Another innovation is the simple 2-wire 4-20 mA connection with communication capabilities for setup, electrode diagnosis, trouble shooting and calibration.

Also, a new double-junction electrode has been developed for the pHix® Compact with lower impedance, increased electrolyte volume, increased junction area and longer lifetime than traditional pH electrodes. The new electrodes can be used successfully in wastewater, potable water and water with low ion concentration.

Features

- Available with 4-20 mA output for pH / redox or with 2 galvanically separated 4-20 mA outputs for both pH and temperature.
- pHix® Compact is completely waterproof, and withstands a static pressure of 5 bar.
- · No need for fittings or cables both electrode connections, transmitter and cable comes as one complete unit.
- · Built-in temperature sensor.
- pHix® Compact is made from chemical resistent Ryton® (PPS) and 316 SS.
- pHix® Compact can be loop powered directly from an active 4-20 mA input on e.g. a PLC or indicator.
- · Automatic electrode monitoring.
- HART® communication with commands for all configuration parameters.

Buffer adjustment

Buffer adjustment is activated by either turning the transmitter 180 ° or by the switch ring that activates a magnetic relay inside

the transmitter.

Buffer adjustment can also be activated from a PLC or through HART® commands via the 4-20 mA channel.

1: Rinse the electrode

The switch ring is set to the pH value of the buffer liquid (4, 7, or 10).

3: pHix® Compact is immersed into the buffer liquid. Zero and span is set automatically.

4: pHix® Compact can be put

Buffer adjustment with tilt switch:

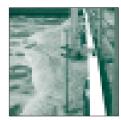

1. Rinse the electrode

2: pHix® Compact is turned . upside down.

3: pHix® Compact is immersed into the buffer liquid. Zero and span is set automatically.

4: pHix® Compact can be put into service.
